

Case Study

The smoke extraction and CO-NO2 detection installations need to be replaced in a Paris private parking lot. The different devices are gathered in tiny premises.

Our Solution

We suggested that all the pollutants detection, control and commands for airflow management be replaced.

We created a customized control board that would be installed in the existing premises.

As no disconnecter was actually installed close to the fans, we suggested new disconnecters with position report .

Our Expertise

Supporting customers all along the project:

- Carrying out the study;
 - Manufacturing customised devices;
 - Placing and connecting the installation;
 - Putting into operation.
